

Weather Wise AI

Phase 1: Brainstorming and Ideation

Weather Wise AI is an intelligent weather assistant that goes beyond raw forecasts. It combines live weather data with machine learning to give accurate predictions and personalised, actionable advice (what to wear, whether to travel, when to water crops, etc.).

Problem Statement

- Most weather apps show numbers and icons but do not explain what they mean for the user's day.
- Short-term local forecasts (hourly, neighbourhood level) are often inaccurate.
- Farmers, commuters, event planners and outdoor workers need decision support, not just data.

Proposed Idea

- An AI model that improves short-term forecasts using historical and live data.
- A conversational assistant that answers questions such as 'Should I carry an umbrella at 5 PM?'
- Personalised alerts for rain, heat, storms, air quality and UV index.

Target Users

- Daily commuters and students
- Farmers and gardeners
- Travellers and event organisers
- Outdoor and delivery workers

Idea Evaluation

Idea	Value	Feasibility	Decision
Accurate hourly forecast (ML)	High	Medium	Include
Chat-based weather assistant	High	High	Include
Personalised smart alerts	High	High	Include
Crop and travel advisory	Medium	Medium	Later release
Voice assistant	Medium	Low	Future scope
