

1. Brainstorm & Idea Prioritization

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The team came together to discuss the everyday difficulty of getting weather information that is accurate, local and easy to act on. After discussion, the problem selected for Weather Wise AI was: *people receive generic weather data but not clear, personalised guidance on what to do with it.*

Step 2: Brainstorm, Idea Listing and Grouping

Each team member listed ideas freely without judging them. The ideas were then grouped by theme:

Theme	Ideas listed
Forecasting	Hyper-local hourly forecast; 7-day outlook; rain and storm probability; temperature and humidity trends
AI Insights	Plain-language weather summary; clothing and umbrella suggestions; travel and commute advice
Alerts	Severe weather alerts; rain reminders; air quality and heat warnings
User Experience	Simple dashboard; city search; auto-detect location; chatbot for weather questions

Step 3: Idea Prioritization

Ideas were ranked by how much value they give users against how easy they are to build.

Priority	Idea	Reason
High	Accurate forecast by location; AI plain-language summary; severe weather alerts	Core value to users and feasible with available weather data
Medium	Clothing/travel suggestions; chatbot Q&A; air quality info	Useful additions once the core is stable
Low	Multi-language voice support; wearable integration	Nice to have, larger effort
